After reading the “slow science” proposal, I personally believe the post-agent era will bring a new mode of arXiv slot-claiming and academic-influence building (which I call “fast-influence research”, or idea citation research):

Post the problem you have observed and your initial solution idea on xhs (Xiaohongshu) or Twitter/X

Let the experiments and the complete paper be advanced step by step later

Even if someone sees your idea and rushes out a paper with a similar core

it does not really matter — you should be glad instead

because it proves that you have foresight and the taste to find problems and solution directions

and if one insists on citations, this can in fact form an idea-citation mode; I am certain this kind of community atmosphere will emerge

I think this is the most important capability in the agent era: the foresight to raise valuable problems and initial directions.

The ability to implement will gradually be aligned onto agents for everyone — ultimately it is a resource-level contest of tokens, compute, and staying up late. But on reflection this is a deeper waste: people hold similar ideas, and someone else gets the publication out simply because they have a little more resource.

This is precisely the research mode of RsiingSI. Because we want to solve the real life-science problems of humanity, if we can throw the problems and the initial ideas out first,

then anyone who sees them and is interested only needs to build them — that is one small step for humanity, and only this can truly accelerate the overall evolution of human society at maximum speed.
